

ACEP 61

Title: Avoidance of Chest X-ray in pediatric patients with Asthma, Bronchiolitis or Croup

Description: Percentage of ED visits for pediatric patients with Asthma, Bronchiolitis or Croup for whom a Chest X-ray was ordered/performed.

Measurement Period: January 1, 2024, through December 31, 2024

Measure Steward: American College of Emergency Physicians (ACEP)

Measure Developer: American College of Emergency Physicians (ACEP)

Measure Scoring: Proportion (**Inverse Measure**)

Measure Type: Process

| | |
|-------------------------------|---|
| Initial Population | All patients less than 18 years of age coming to the Emergency Department with a diagnosis of Asthma, Bronchiolitis or Croup |
| Denominator | Equals Initial Population |
| Denominator Exclusions | History of Cystic Fibrosis, Airway Malformations, Immunodeficiency Syndromes, Pneumonia |
| Numerator | All patients less than 18 years of age with a diagnosis of Asthma, Bronchiolitis or Croup and for whom a chest x-ray was ordered/performed. |
| Numerator Exclusions | Not Applicable |
| Denominator Exceptions | None |

Stratification: None

Risk Adjustment: None

Improvement Notation: Lower score indicates better quality

Rationale

Bronchiolitis is a self-limiting viral infection causing lower respiratory tract illness, most common in infants under 12 months of age. Advanced imaging is not indicated for routine evaluation or monitoring of bronchiolitis. (1)

Clinical practice guidelines of the American Academy of Pediatrics (AAP), published in 2006 and revised in 2014, recommend against routine radiography in the evaluation of infants with bronchiolitis.(2)

Unnecessary imaging for bronchiolitis contributes to health care costs, radiation exposure, and antibiotic overuse and consequently was identified in 2013 as a national “Choosing Wisely” priority.

2. Ralston SL, Lieberthal AS, Meissner HC, et al; American Academy of Pediatrics. Clinical practice guideline: the diagnosis, management, and prevention of bronchiolitis. Pediatrics. 2014;134(5):e1474-e1502. doi:10.1542/peds.2014-2742

Clinical Recommendation Statement

National guidelines articulate a reliance on physical examination and patient history for diagnosis of asthma and bronchiolitis in the pediatric population. Multiple studies have established limited clinical utility of chest radiographs for patients with asthma or bronchiolitis. Omission of the use of chest radiography will reduce costs, but not compromise diagnostic accuracy and care.
